

Sentinel-2 Mission Overview

Sentinel-2 is a European wide-swath, high-resolution, multispectral imaging mission developed by the European Space Agency. The mission supports monitoring of vegetation, soil and water cover, inland waterways and coastal areas.

The twin satellites, Sentinel-2A and Sentinel-2B, fly in the same orbit, phased at 180 degrees to each other. Together they provide a revisit time of five days at the equator.

The MultiSpectral Instrument (MSI) samples 13 spectral bands at spatial resolutions of 10, 20 and 60 metres.
